

*Chronic Illness Breakthrough
with Delayed Food Allergy Testing*

Over 70% of all chronic sufferers of illnesses which have proven to be unresponsive to conventional therapies experience good-to-excellent, long-term relief of symptoms solely by the elimination of IgG-mediated delayed food allergens from their diets. 20% to 25% of these same chronic sufferers obtain 100% relief of all symptoms.

Dixon HS. Treatment of delayed food allergy based on specific immunoglobulin G RAST testing. Otolaryngol Head Neck Surg 2000; volume 1213: pages 48-54.

&

Independent scientific audit of 2567 patients with long-term illnesses by the Department of Health Studies of the York University, York, England, on behalf of the British Allergy Foundation. Study & fact sheet released January 22nd, 2001.
